INTRODUCTION

One of the purposes of the U. S. Regional Soybean Industrial Products Laboratory 2/ was to develop improved varieties and strains of soybeans for industrial utilization. To provide a more rapid and accurate method of evaluating new strains developed through the cooperative breeding work, two uniform soybean variety and strain tests were established in the spring of 1939. One of these, now designated the Uniform Test Group II, was made up of varieties and selections of suitable maturity for the northern part of the soybean region and was planted that season at nine locations extending from Ohio to Iowa. The late nursery (Group IV) composed of strains having a maturity later than Illini and Dunfield was planted at 11 locations

1/ Agronomist, Assistant Agronomist, Junior Agronomist, and Cooperative Agent, respectively, Division of Forage Crops, Bureau of Plant Industry. Credit is due Ruth E. Schmutzler for assistance in tabulating and summarizing the data.

2/ A cooperative organization participated in by the Bureaus of Agricultural Chemistry and Engineering and Plant Industry of the U. S. Department of Agriculture and the Agricultural Experiment Stations of the North Central states of Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

in southern Indiana, Illinois, and Missouri. The work was continued during 1940 and 1941 with the addition of the uniform midseason nursery (Group III) designed to test selections intermediate in maturity between the first two tests.

This present report includes the detailed results of the Uniform Tests for the 1941 season, as well as the 2- and 3-year summaries of agronomic and chemical information obtained on the strains.

COOPERATING AGENCIES AND PERSONNEL

Bureau of Plant Industry:

Division of Forage Crops and Diseases: Jackson L. Cartter, Leonard F. Williams, Albert H. Probst, Martin G. Weiss (on military furlough), Charles R. Weber, Denver I. Allen, Forest K. Jay

Bureau of Agricultural Chemistry and Engineering: Turner H. Hopper

Illinois Agricultural Experiment Station:

Agronomy Department: W. L. Burlison, C. M. Woodworth

Indiana Agricultural Experiment Station:

Agronomy Department: G. H. Cutler

Iowa Agricultural Experiment Station:

Farm Crops Department: H. D. Hughes

Missouri Agricultural Experiment Station:

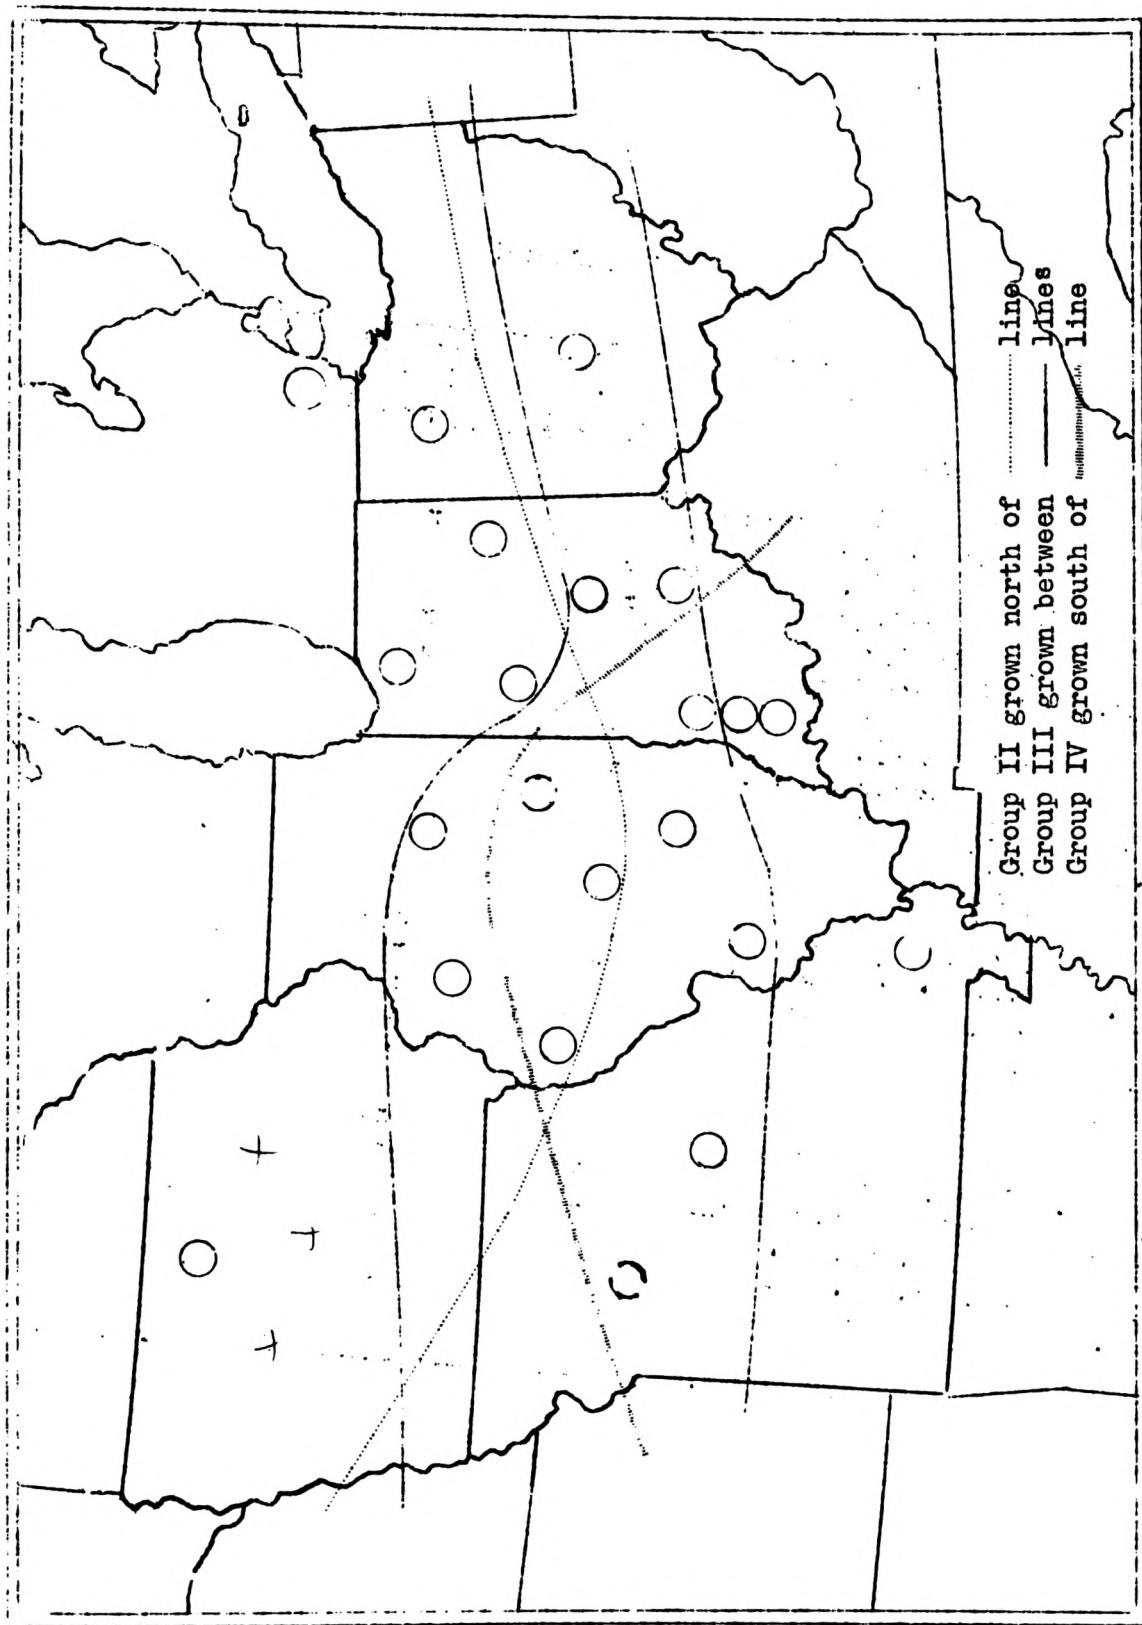

Field Crops Department: W. C. Etheridge

Ohio Agricultural Experiment Station:

Agronomy Department: R. D. Lewis

Map of Soybean Belt showing location of the Cooperative Uniform Tests

METHODS

The tests have been planted in replicated rod row plots, using either a lattice square design with three replications or a restricted randomized block design with four replications. Row widths have been those in common use by the cooperating stations or for the outlying nurseries by the cooperating farmers. In most cases two hundred viable seed per row have been planted and stands have been satisfactory throughout the region.

Yields were taken on individual replications after all samples in a test had been dried to a uniform moisture basis.

Chemical composition was determined for each strain on composite samples prepared by combining equal amounts of seed from every location included in each Uniform Test. The location composites were prepared by combining equal weights of seed of each of the strains in a group at an individual location. Percentage composition of the seed is expressed on a moisture-free basis. Seed size was also determined on this composite sample and recorded as weight (in grams) per 100 seed.

Lodging notes were recorded on a scale of 1 to 5 as follows:

1. Almost all plants erect
2. Either all plants leaning slightly, or a few plants down
3. Either all plants leaning moderately, or 25% to 50% of the plants down
4. Either all plants leaning considerably, or 50% to 80% of the plants down badly
5. All plants down badly

Height was determined as the length of plant from the ground to the growing tip at time of maturity.

Maturity was taken as the date when the leaves had dropped and the stems and pods were sufficiently dry for combine harvesting. Maturity

was expressed as days earlier (-) or later (+) than a standard or reference variety. For the Uniform Tests, Group II and Group III, Illini was used as the reference variety. For the Uniform Test, Group IV, the variety Gibson was used.

Seed quality was expressed on a uniform scale from 1 to 5 as follows:

1. Very good
2. Good
3. Fair
4. Poor
5. Very poor

In estimating seed quality the factors considered were: development of seed, wrinkling, damage, and abnormal color for the variety.

UNIFORM TEST, GROUP II

The Group II test in 1941 was composed of nine strains in commercial production, five USDA foreign introductions and ten selections from hybrids. The origin of these strains in Uniform Test Group II, 1941, is as follows:

Strain	Source or Originating Agency	Origin
Dunfield	Purdue Agr. Exp. Sta.	PI 36846 1/
Mandell	Purdue Agr. Exp. Sta.	Selection from Manchu
Kichland	Purdue Agr. Exp. Sta.	PI 70502-2
C7	Purdue Agr. Exp. Sta.	CX331-412-1-2-1 (Illini x Mandell)
C28	Purdue Agr. Exp. Sta.	CX931-1 (Natural hybrid)
C83	Purdue Agr. Exp. Sta.	CX431-209-1-2-2 (Illini x Midwest)
C163	Purdue Agr. Exp. Sta.	CX331-457-2-3-1 (Illini x Mandell)
C164	Purdue Agr. Exp. Sta.	CX431-39-1-3-1 (Illini x Mandell)
Mukden	Iowa Agr. Exp. Sta.	PI 50523-Q

1/ Division of Plant Exploration and Introduction, Bureau of Plant Industry, U.S.D.A.

2/ Division of Forage Crops & Diseases, Bureau of Plant Industry, U.S.D.A.

The group of hybrids has in general been very promising. Yields should be compared with the idea of relative maturity in mind. The selection C28, for instance, is relatively low yielding; but it is by far the earliest strain in the test, while C163--although relatively high in yield--is quite late for this test. C163, C83, C164, C7, and 88447-2 are all later than Illini and so will not be continued in the 1942 test.

In general most of the tests in 1941 were quite satisfactory. The coefficients of variability range from 7.0% to 15.0%. A summary of the combined analysis of variance is given in Table 8. It will be noted that the varieties x locations interaction, though not large, is highly significant.

A summary of the 2-year averages is given in Table 9. Strains L6-685 and L6-12 have been consistently high in yield in the two years, as well as in previous non-uniform tests. These two strains are only slightly earlier than Illini. They have had the highest quality seed for the two-year average; and L6-685 has been outstanding in resistance to lodging, although not the best in this respect. A study of the chemical data in Table 9 also indicates that L6-685 is outstanding in percent of oil and iodine number of oil. Table 11 presents a summary of individual analyses of L6-12 and L6-685 compared to three good commercial varieties. It will be noted that L6-685 has been consistent in its superiority in percent oil. It is planned to increase this latter strain in 1942 with a view toward a possible release.

The introductions PI 68474, PI 91161, and PI 70478 have all exceeded Dunfield in percent oil for the 2-year period and probably will prove to be valuable in the breeding program, although they are not outstanding in yield or lodging resistance. PI 68474 is probably the best of the three, since it has been higher in yield, earlier, and has a satisfactory iodine number; while PI 91161 and PI 70478 are, like Dunfield, Richland, and Mukden, low in this respect.

PI 92717 may also prove valuable in the breeding program.

UNIFORM TEST, GROUP III

The 16 strains in the 1941 Group III test include six named varieties, two of which have been recently released, and nine selections.

The origin of these strains is as follows:

<u>Strain</u>	<u>Source or Originating Agency</u>	<u>Origin</u>
C2	Purdue Agr. Exp. Sta.	CX231-261-1-1-1 (Dunfield x Midwest)
C79	Purdue Agr. Exp. Sta.	CX331-129-2-2-2 (Illini x Mandell)
Patoka	Purdue Agr. Exp. Sta.	PI 70218-2-19-3
Dunfield	Purdue Agr. Exp. Sta.	PI 36846
L4-432	Ill. Agr. Exp. Sta.	Sel. from mixed hybrid pop.
L4-506	Ill. Agr. Exp. Sta.	Sel. from mixed hybrid pop.
L6-13	Ill. Agr. Exp. Sta.	Sel. from mixed hybrid pop.
L6-23	Ill. Agr. Exp. Sta.	Sel. from mixed hybrid pop.
L6-690	Ill. Agr. Exp. Sta.	Sel. from (Mandarin x Mansoy)
L7-1087	Ill. Agr. Exp. Sta.	Sel. from LX157 (Illini x T48)
L7-1355	Ill. Agr. Exp. Sta.	Rogue in PI 81041
Chief	Ill. Agr. Exp. Sta.	Sel. from (Illini x T95, Manchu Line A)
Illini	Ill. Agr. Exp. Sta.	Selection from A.K.
Scioto	Ohio Agr. Exp. Sta.	Selection from Manchu
Manchuria 13-177	Ohio Agr. Exp. Sta.	Selection from Manchuria
McClave	Charles McClave	Farmer's selection

In general the coefficients of variability for yield were higher in the Group III test than in the Group II test. A summary of the analysis of variance for Group III is given in Table 20.

The variance due to location was not as great as in the Group II test. The varieties x locations interaction is highly significant, although not very great.

The strains C2 and L7-1355 have the highest average yield for 1941, but both of these strains are somewhat late for this test. McClave is

also much later than any other strain in the test but has been a very poor yielder. It will also be noted that the seed of this variety has a very low percentage of oil.

The average data for Group III for the 2-year period, 1940-1941, are presented in Table 22. L7-1355, L6-690, and Manchuria 13-177 have a good yield record in this test, but L7-1355 and Manchuria 13-177 have a low iodine number, and the latter lodges very badly. L6-690 has a relatively high iodine number. L6-23, L4-506, and L4-432 have a definitely lower oil content and will not be continued in the test in 1942. L6-13 and C79 have not been sufficiently outstanding in any particular to warrant their retention.

Table 13. Summary of agronomic and chemical data for the strains in the Uniform Test, Group III, 1941.

Strain	Yield (Bu/A)	Lodge- ing	Height	Matu- rity	Seed Qual- ity	Seed Size	Per- cent Pro- tein	Per- cent oil	Iodine number of oil

UNIFORM TEST, GROUP IV

The origin of the strains in the Group IV test in 1941 is as follows:

Strain	Source or Originating Agency	Origin
C6	Purdue Agr. Exp. Sta.	CX331-200-1-2-1 (Illini x Mandell)
C146	Purdue Agr. Exp. Sta.	CX231-14-1-3-1-7-1 (Dunfield x Midwest)
C148	Purdue Agr. Exp. Sta.	CX231-55-1-10-1-25 (Dunfield x Midwest)
C149	Purdue Agr. Exp. Sta.	CX231-108-2-8-1-5-1 (Dunfield x Midwest)
C153	Purdue Agr. Exp. Sta.	CX231-298-1-1-1-1-9 (Dunfield x Midwest)
C154	Purdue Agr. Exp. Sta.	CX231-376-1-2-2-6-4 (Dunfield x Midwest)
C155	Purdue Agr. Exp. Sta.	CX231-393-1-2-1-4-9 (Dunfield x Midwest)
C156	Purdue Agr. Exp. Sta.	CX331-51-14-1-7-4 (Illini x Mandell)
C160	Purdue Agr. Exp. Sta.	CX331-136-1-1-1 (Illini x Mandell)
C167	Purdue Agr. Exp. Sta.	CX531-265-1-5-5 (Midwest x Dunfield)
C169	Purdue Agr. Exp. Sta.	CX531-265-2-1-1-8 (Midwest x Dunfield)
C171	Purdue Agr. Exp. Sta.	CX531-468-3-3-2 (Midwest x Dunfield)
C175	Purdue Agr. Exp. Sta.	CX731-268-1-5-2-9 (Dunfield x Man. Sel. 31)
C178	Purdue Agr. Exp. Sta.	CX831-88-3-1-3-3 (Dunfield x Man. Sel. 21)
C180	Purdue Agr. Exp. Sta.	CX831-151-2-5-2-5 (Dunfield x Man. Sel. 21)
C183	Purdue Agr. Exp. Sta.	CX831-362-1-3-1-6-5 (Dunfield x Man. Sel. 21)
Patoka	Purdue Agr. Exp. Sta.	PI 70218-2-19-3
Boone	Mo. Agr. Exp. Sta.	PI 54563-3
L7-923	Ill. Agr. Exp. Sta.	Selection from mixed hybrid population
L7-1160	Ill. Agr. Exp. Sta.	LX157 (Illini x T48 (T48 is from Manchu x Ebony))
L7-1355	Ill. Agr. Exp. Sta.	Rogue in PI 81041
Chief	Ill. Agr. Exp. Sta.	Illini x Manchu
Macoupin	Elmer Hulcher	Selection from commercial lot
Morse	U.S. Dept. of Agriculture	PI 19186

A number of strains of hybrid origin were higher yielding than the named varieties in the 1941 tests. Most of these are from the cross, Dunfield x Midwest or its reciprocal.

A summary of the combined analysis of variance for this test in 1941 is given in Table 30. The varieties x locations interaction, while not large, is highly significant.

The four strains ranking highest for yield in the 2-year summary, Tables 31 and 32, are all selections from the cross, Dunfield x Midwest. None of the strains in this test are outstanding in chemical composition, but all are satisfactory.

Among the strains in this test are the two varieties, Gibson and Patoka, recently released by the Purdue Experiment Station, and Boone (PI 54563-3) recently named by the Missouri Experiment Station. These three varieties have been in the Uniform Tests for three years and their relative performance may be noted in Table 33, a summary of three years.

The results of this uniform testing work and of other testing work incidental to the breeding program have made it possible to evaluate the available material in regard to its possible use in future breeding work. A brief summary of some of the superior germ plasm available in maturity groups covered by these tests is as follows:

<u>Yield</u>	<u>Lodging Resistance</u>	<u>Percent Oil</u>	<u>Iodine No.</u>
Dunfield	Patoka	Dunfield	
Midwest	Richland	Illini	
Illini	L6-685	Scioto	
Patoka	T48	T117	
Gibson	L7-1111	Man.13-177	
C171	L6-685		
L7-1355	PI 68474	Wild soybean	
Man.13-177	PI 70478	Scioto	
Scioto	PI 91161	Peking	
L6-685	6-685		
L6-12	6-12		
	6-690		
	PI 92717		

No attempt has been made to arrange these strains in the order of their relative value.

Table 23. Summary of agronomic and chemical data for the strains in the Uniform Test,
Group IV, 1941.
